TITLE: Determination of the moments and forces acting on a rotating body in free molecular flow and in a light flux

SOURCE: Inzhenernyy zhurnal, v. 5, no. 5, 1965, 954-958

TOPIC TAGS: rotation, solid mechanics, fluid mechanics, free molecular flow, light radiation

ABSTRACT: We designate by p and tau the normal and tangential components of the forces acting on an element of surface of the body, related to the velocity head  $\rho V_0^2/2$ . The direction of tau is given by a unit vector of the tangent to the surface of the body, t, directed so that

$$t \sin \theta = n \times \left( \frac{V}{V} \times n \right) = \frac{V}{V} - n \cos \theta. \quad (1)$$

Card 1/2

UDC:533.6.011.8

L 7921-66

ACC NR: AP5026695

Here  $n$  is the unit vector of the internal normal to the surface of the body;  $\theta$  is the angle between  $n$  and  $V$ , the velocity vector of the element

$$V = v_0 + \Omega \times r_A, \quad (2)$$

$\Omega$  is the vector of the angular velocity of the body;  $r_A$  is the radius vector of the element with respect to the center of mass  $A$ . Based on these premises, the article derives a formula for determination of  $M_d$ , the moment of force due to the rotation of the body. It is stated that this solution can be applied also to determination of  $M_d$  for an arbitrarily rotating plate, an important case in practice. Orig. art. has: 9 formulas.

TITLE: Characteristics of a hypersonic viscous gas flow past bodies of simplest shape and their aerodynamic characteristics

SOURCE: <sup>1, 55</sup> Inzhenernyy zhurnal, v. 5, no. 6, 1965, 1010-1020

TOPIC TAGS: hypersonic aerodynamics, aerodynamic characteristics, viscous flow, boundary layer, lift, drag coefficient, friction coefficient

ABSTRACT: This paper presents an analysis of theoretical and experimental data obtained from a large number (19) of studies related to the characteristics of hypersonic viscous gas flows past slender sharp- and blunt-nosed cones and their aerodynamic characteristics at various angles of attack in thermodynamically perfect gas flows. In section 1, hypersonic viscous flows past heat-insulated and cooled ( $T_w \ll T_0$ ) slender, sharp-nosed cones with various semiapex angles  $\theta$  and angles of attack  $\alpha$  are considered. The behavior of drag and lift coefficients under various flow conditions, their dependence on the Knudsen number and parameter  $\theta/\sqrt{Re}$ , and the limits of applicability of the free molecular theory are discussed. Section 2 deals with hypersonic viscous flows past blunt-nosed cones and discusses the effects of viscosity and bluntness on the drag coefficient, the boundary

L 10904-66

ACC NR: AP6002614

layer displacement effect on flow, similarity parameters, and conditions at various angles of attack. Hypersonic rarefied gas flows over flat plates are treated in section 3, where the effect of rarefaction on the friction coefficient, the flow above the plate and the influence of the angle of attack on zones of rarefaction are examined. An approximate method for calculating the flow past slender blunted bodies is outlined in section 4. The complexity of the determination of the inviscid part of the flow is stressed and the necessity of using rough assumptions, as has been done by H. K. Cheng (TASS v. 28, no. 5, 1961), is pointed out. Hypersonic, viscous flow past a blunt-nosed cone is treated as an illustrative example, assuming that the pressure on the outer boundary of an entropy layer is given by the Busemann formula. Distributions of boundary layer thickness, friction and drag coefficients, and pressure on the cone surface were calculated on a computer. The pressure distribution which characterizes the effect of boundary layer-viscous flow interaction on the flow structure is given in graphs and appears primarily in the region of minimum pressure and behind it. Orig. art. has: 9 figures and 4 formulas.

TITLE: On exact solutions of kinetic moment equations of monatomic gas mixtures

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 5, 1966, 41-50

TOPIC TAGS: reentry aerodynamics, rarefied gas, gas kinetics, Boltzmann equation, Navier-Stokes equation, transverse flow, plane flow

ABSTRACT: A class of exact solutions of a system of kinetic moment equations of a monatomic gas in the absence of external forces is generalized to the case of a mixture of monatomic Maxwellian gases with external forces taken into account. The simplest solutions are obtained for this class of flows that can be considered as examples of the conventional solution of the Boltzmann equation with the Chapman-Enskog approach. These various exact solutions are analyzed and the applicability of various methods to solving the Boltzmann equation is discussed. It was found that the most important property of these solutions is that their expansions in  $1/K$  power series, related to a free-molecular solu-

Card 1/2

L 08054-67

ACC NR: AP6034537

tion, converge over a substantially greater range of  $K$  than the Chapman-Enskog series, and even includes the  $K \geq 1$  domain. The author considers this as confirmation of the effectiveness of the iteration method and expansions in series as ways to solve the Boltzmann equation in calculations of rarefied gas flows over bodies. Orig. art. has: 48 formulas.

**AUTHORS:** Kogan, N.G., Eng Maj and Galkin, Ya.B., Eng Maj

**TITLE:** Maintenance of Airfields in Winter (Soderzhaniye aerodroma zimoy)

**PERIODICAL:** Vestnik Vozdushnogo Flota, 1958, Nr 1, pp. 66-68 (USSR)

**ABSTRACT:** The article deals with the problem of how to prolong the duration of service life of paved runways (concrete, asphalt, or metal surfacing) of the airfields. Considerable damage is done to the paved runways not only during the snow removal by snowplows, but also by the use of chemicals and heat against the ice. The sharp changes in temperature have a damaging effect, particularly on the asphalt and concrete pavement of runways. Much damage is done to the paved runways by the fact that the soil below the pavement freezes much deeper than the unpaved soil covered with snow and with the arrival of warm

Card 1/3

Maintenance of Airfields in Winter (Cont.)

weather the foundation under the pavement begins to thaw out earlier than under the side strips of the runway. The authors suggest that the paved runways should not be used during the winter in regions with considerably low temperatures, instead, unsurfaced strips should be used for the landing and takeoff of aircraft. In case the paved runways are equipped with permanent landing lights, they, of course, must be cleaned from snow, although, the authors think that, even in such cases, it would be preferable to use unsurfaced takeoff and landing strips equipped with a portable landing light system. Sometimes up to 6 cm layer of packed snow should be left on the pavement as a protective cover against mechanical damages. According to the authors, in the interest of greater efficiency in combat readiness of the units, the everyday flights should be carried out from the unsurfaced strips of the airfield, and the paved runways should be used only in exceptional cases. Experience has shown that this is quite

Card 2/3

Maintenance of Airfields in Winter (Cont.)

possible on airfields with loamy soil and, particularly, when on the strips heavy rollers were used to improve the bearing capacity of the surface. On such improved airfields the aircraft up to 30 tons of gross weight and with a tire pressure up to 9 atm can be operated very successfully. One diagram.

TITLE: Investigation of the internal friction of ice plates with a layer of snow during bending vibrations

SOURCE: Akusticheskiy zhurnal, v. 12, no. 4, 1966, 411-415

TOPIC TAGS: ice, snow, vibration analysis, friction

ABSTRACT: The internal friction of homogeneous ice plates with a surface snow layer was investigated during bending vibrations in the temperature region from 0 to -20C. The values for the logarithmic decrement  $\Delta$ , coefficient of loss  $\xi$ , and the energy absorption coefficient  $\psi$  were determined. The determination is based on the well-known expression for the eigenfrequencies of bending vibrations of plates

$$\omega_n = \frac{\pi^2 (2n-1)^2 \sqrt{Eh^2}}{4n^2 \sqrt{12\rho_0(1-\nu)^2}}$$

Fig. 1. Logarithmic decrement  $\Delta$  as a function of the temperature and amplitude of vibration

zh., 1958, 4, 19—23). Numerical values for  $\Delta$ ,  $\xi$ , and  $\psi$  were determined with an experimental installation consisting of a vibrator, sound receiver, and oscillograph. The experimental results are summarized in graphs and tables (see Fig. 1). It was found that the loss of mechanical energy in nonhomogeneous ice plates depends on the amplitude of vibration and the temperature. The inner friction of ice is increased considerably by a surface snow layer, especially if the thickness of the latter exceeds one half the thickness of the ice plate. The authors thank V. N. Krasil'nikov for his valuable advice. Orig. art has: 1 table, 6 graphs, and 10 equations.

TITLE: Study of the subsolidus part of the  $\text{SrO-ZrSiO}_4$  system

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 11, 1965, 2000-2004

TOPIC TAGS: zirconium compound, strontium compound, silicate

ABSTRACT: The subsolidus part of the  $\text{SrO-ZrSiO}_4$  system was studied at 1150 and 1350°C in pressed and sintered samples with molar ratios of  $\text{SrO:ZrSiO}_4$  ranging from 9 to 0.5. The phase composition of the products formed by zirconia with strontium oxide was determined by chemical, x-ray diffraction and petrographic analyses. From the data obtained, a tentative plot of the subsolidus part of the  $\text{SrO-ZrSiO}_4$  system was made (see figure 1). Strontium zirconium silicate  $\text{Sr}_6\text{ZrSi}_5\text{O}_{18}$  and strontium orthozirconate were identified but  $\text{Sr}_3\text{SiO}_5$  and  $\text{Sr}_2\text{ZrO}_4$  were not formed. No attempt was made to determine the possible regions of existence of solid solutions. The authors thank

TITLE: Obtaining of strontium and barium zirconates under hydrothermal conditions

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 1, 1966, 216-219

TOPIC TAGS: strontium compound, barium compound, zirconium compound, zirconate

ABSTRACT: To extend the currently available data on the synthesis of strontium and barium zirconates under hydrothermal conditions, the reaction of  $\text{Sr}(\text{OH})_2$  and  $\text{Ba}(\text{OH})_2$  with calcined  $\text{ZrO}_2$  and zirconyl oxychloride was studied. The reactions were carried out in the autoclave in a carbon dioxide-free atmosphere over a temperature range 200C--350C. The experimental results are tabulated. A microphotograph of  $\text{BaZrO}_3$  is presented. X-ray powder spectra of the synthesized compounds were determined. It was found that in the temperature range 180--350C and reagent ratio  $\text{MeO}:\text{ZrO}_2$  of 1.5:3 (where Me = Ba, Sr) a metazirconate of Ba and Sr is formed, while the corresponding calcium metazirconate is not formed under these conditions. It is concluded that the hydrothermal method for the synthesis of  $\text{BaZrO}_3$  and  $\text{SrZrO}_3$  yields a better quality

TITLE: Study of the  $\text{BaO-ZrO}_2\text{-SiO}_2$  system at subsolidus temperatures

SOURCE: AN SSSR. Doklady, v. 169, no. 3, 1966, 645-647

TOPIC TAGS: barium compound, zirconium compound, silicate, *PHASE DIAGRAM*

ABSTRACT: The subsolidus structure and ternary compounds of the  $\text{BaO-ZrO}_2\text{-SiO}_2$  system (prepared by sintering powdered  $\text{SiO}_2$ ,  $\text{ZrO}_2$  and  $\text{BaCO}_3$ ) was studied by using x-ray phase, chemical and in some cases petrographic methods of analysis. In the BaO-rich region, the coexisting phases are  $\text{Ba}_3\text{SiO}_5\text{-Ba}_2\text{SiO}_4$ ;  $\text{Ba}_3\text{SiO}_5\text{-BaZrO}_3$ ;  $\text{Ba}_2\text{SiO}_4\text{-BaZrO}_3$ ;  $\text{BaSiO}_3\text{-BaZrO}_3$ . The composition of two additional compounds was established by studying the triangular phase diagrams of the systems  $\text{BaSi}_3\text{O}_8\text{-ZrO}_2\text{-Ba}_2\text{Si}_3\text{O}_8$  and  $\text{Ba}_2\text{Si}_3\text{O}_8\text{-ZrO}_2\text{-SiO}_2$ ; their formulas are  $2\text{BaO}\cdot2\text{ZrO}_2\cdot3\text{SiO}_2$  and  $\text{BaO}\cdot\text{ZrO}_2\cdot3\text{SiO}_2$ . These zirconium silicates are obtained by sintering from the oxides for 24-30 hr at  $1300^\circ\text{C}$ . Their physicochemical properties were determined, and their x-ray powder patterns are given. The paper was presented by Academician Belov, N. V., 25 Nov 65. Orig. art. has: 3 figures and 1 table.

**TITLE:** A standard series of main parameters of valve and  
tubular type lightning arresters (for discussion)

**PERIODICAL:** Referativnyy zhurnal, Elektrotekhnika i energetika,  
no.9, 1961, 38, abstract 9I 245. (Vestn. elektroprom-  
sti, no.12, 1960, 27-31)

**TEXT:** The article proposes the classification of valve and  
tubular lightning arresters into a standard series of main  
parameters. Magnetic-valve arresters developed for 110-120 kV  
are of improved protective characteristics, so permitting reduction  
in impulse test voltages and also facilitating insulation of  
transformers and equipment. In order to improve the technical and  
economic characteristics of Soviet 220-500 kV transformers it is  
necessary to improve the protection ratio of lightning arresters to  
2.0 - 1.9 and of machine arresters to 1.8 - 1.9. On the basis of  
analysis of the current standard for valve-type arresters, of a  
Card 1/4

A standard series of main parameters.. S/196/61/000/009/038/052  
E194/E155

draft standard for magnetic-valve arresters, and of the prospects of developing new arresters with improved protection, the following series of protection ratios is recommended for arresters rated from 3 to 500 kV: 3.3-3.1; 3.0-2.8; 2.6-2.5; 2.5-2.3; 2.2-2.1; 2.0-1.9; 1.9-1.8. It is recommended that the standard series of arresters rated from 3 to 220 kV should be arranged according to the parameters of the maximum value of short-circuit current interrupted in each voltage class, with an indication of the minimum permissible value of the ratio of highest to lowest short-circuit current interrupted. It is possible to increase the interrupting capacity of tubular arresters type PTB (RTV) by reinforcing them by a multi-layer winding of glass fibre cloth grade ЭСТБ-6 (ESTV-6) applied to the thin-walled arc-suppression tube, which is made of hard polyvinyl chloride plastic. In this way arresters have been developed for voltages of 35 - 110 kV and short-circuit currents of 20 kA. However, it is not yet technically possible to develop tubular arresters for voltages of 35 - 220 kV for interrupting short-circuit currents exceeding 30 kA, and coordinating gaps combined with automatic repeated reclosure of the lines are the recommended alternative.

A standard series of main parameters.. S/196/61/000/009/038/052  
E194/E155

A standard series of tubular arresters from 3 to 220 kV selected according to the maximum values of short-circuit current interrupted can be: 2.5; 5; 10; 20; and 30 kA effective. Here the minimum ratio of the maximum permissible short-circuit current to the minimum for tubular arresters of 3 - 6 - 10 kV should be 8; for those of 35 - 60 - 110 - 220 kV the recommended figure is 5. In conformity with the existing standard series of tubular arresters, the nomenclature  $\text{PT}\Phi$  (RTF), RTV, and  $\text{PTBY}$  (RTVU) is applied to the new arresters in the range from 3 to 220 kV. They should be developed and manufactured for various voltages and ranges of short-circuit current interrupted, and each voltage class should be provided with fittings for mounting and recording operations. It is proposed to develop tubular arresters for voltages of 3 - 6 - 10 kV using cheap, strong and moisture-resistant materials, and to satisfy the demand for tubular arresters for 35 - 60 - 110 - 220 kV by types RTV and RTVU. The proposed classification will help to avoid duplication of manufacture of electrical equipment and will most conveniently satisfy the design organisations, operating companies and

U.S.S.R., Moscow). *Voprosy Pitaniya* 15, No. 5, 37-42 (1956).--In a series of expts. conducted in several restaurants it was shown that vitamin C can be greatly in-

creased in the meals by using vitaminized salt (to which salt contg. 0.15% moisture was added 0.8% nicotinic acid). Vitamin A can be increased in the meals by using vitamin A-enriched fat and the destruction of the vitamin during the meals' prepn. can be prevented by adding to the edible fats a mixt. of tocopherols (E). By anal. data. of corn and soybean oils, preps. of E have been obtained contg. 7.8% of a mixt. of  $\alpha$ -,  $\beta$ -, and  $\gamma$ -E. The meals prepn. by

using fats contg. 0.75 mg. % of E contained 70-80% of the original amt. of vitamin A in the foods used for the prepn. of the meals. E. Wierlich

TITLE: Stability of a heated fastened plate under displacement

SOURCE: Inzhenernyy zhurnal, v. 4, no. 1, 1964, 60-68

TOPIC TAGS: stability, heated plate, fastened plate, square plate, plane form of equilibrium, curved form of equilibrium, temperature stress, bifurcation deflection

ABSTRACT: The authors consider the case of instability of a curved form of equilibrium (caused by preliminary heating) in contrast to the usual formulation of plate stability problems involving instability of the plane form of equilibrium for a heated square plate with fastened contours under displacement. Graphical comparisons are made between experimental data and the numerical results derived in the paper. Orig. art. has: 6 figures and 31 formulas.

TITLE: Problem of perturbation of light coherence by frosted glass surfaces

SOURCE: Zhurnal prikladnoy spektroskopii, v. 5, no. 4, 1966, 451-455

TOPIC TAGS: light coherence, frosted glass, optic glass, surface roughness, refractive index, glass surface, light transmission

ABSTRACT: A study was made of the degree of perturbation passing through an uneven frosted glass surface prepared from five types of optical glass. The glasses were wetted with distilled water, glycerin, and cedar oil. The measurements have been made using the photoelectric apparatus assembled according to the Young diagram. Curves have been plotted from which one can see the character of visibility change of the interference pattern as a function of the degree of roughness of the frosted glasses and the difference in the refractive indices of the samples and immersion liquids. The coefficient of coherence  $k$  changes from 0.96 to 0.40 and depends linearly on the optical path difference between the beams passing through

Cements, Limes, and Planters

Effect of different gypsum modifications on the sulfate resistance of Portland cement with and without *gliesh*. I. S. KANT-SHPOLOVSKIY AND G. V. GALKINA. *Trudy Inst. Khim. Akad. Nauk Uzbek. S.S.R.*, 3, 115-32 (1952). The addition of up to 15% of gypsum dihydrate, hemihydrate, and anhydrite to Portland cement with and without *gliesh* resulted in rapid reaction between the gypsum and Ca aluminates, with the formation of sulfoaluminates. Reaction was most intensive for Portland cement, followed by Portland cement containing 30% *gliesh*; the intensity decreased as the *gliesh* content increased to 50%. The gypsum is bound during the first periods of hardening. Sulfate resistance of cements containing about 7%  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  was raised noticeably by the addition of about 15% gypsum. Portland cement containing 50% *gliesh* showed considerable sulfate resistance even without the addition of gypsum. The work will be continued. Cf. "Hardening of *gliesh*..." this section. H. Z. K.

Cement, Concrete, and Other Building  
Materials

Effect of different modifications of gypsum on the sulfate resistance of portland cement with and without gliexh. I. S. Koptanov'ski and G. V. Galkina. *Trudy Inst. Khim. Akad. Nauk Uzbek. S.S.R.* 3: 115-32 (1952).—Addn. of up to 15% of  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ ,  $\text{CaSO}_4 \cdot 1/2\text{H}_2\text{O}$ , and  $\text{CaSO}_4$  to portland cement with and without gliexh results in rapid chem. reaction with Ca aluminates, forming sulfoaluminates. A more intensive reaction occurs for portland cement than for portland cement contg. 30% gliexh; the intensity decreases for 50% gliexh. The gypsum is bound during the first periods of hardening. Addn. of up to 15% gypsum to the cements contg. about 7%  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  raised their sulfate resistance noticeably. Even without the addn. of gypsum, portland cement contg. 50% gliexh showed considerable sulfate resistance. B. Z. Kamich.
